Field Activity Advisory
California Central Valley Steelhead Monitoring Plan
December 1, 2018 – April 30, 2019

As part of the San Joaquin River Restoration Program (SJRRP), biologists will perform a monitoring effort to identify presence/absence of adult California Central Valley (CCV) steelhead (*Oncorhynchus mykiss*; Figure 1) in the upper San Joaquin River (SJR) and its adjacent sloughs. CCV steelhead are believed to be extirpated upstream of the Merced-SJR confluence. However, recent restored flows reconnecting historically desiccated river sections could attract migrating adult steelhead into the Restoration Area. Adult steelhead accessing the SJR upstream of the Merced River confluence could be exposed to loss into sloughs and would not have access to appropriate spawning habitat due to impassable barriers. As a result, the Program has implemented a steelhead monitoring and detection plan (SMP) for the SJR upstream of the Merced River confluence that would, in the event of a capture, document and transport the fish to suitable habitats downstream of the Merced River confluence.

**Who:** U.S. Bureau of Reclamation

**What:** CCV Steelhead Monitoring Plan is an important SJRRP effort to ensure its commitment to restore and maintain fish populations within the Restoration Area. No CCV steelhead were detected or captured during past sampling efforts.

Migrating adult steelhead are difficult to monitor using techniques (e.g., carcass surveys, snorkel surveys, redd counts) commonly used to assess salmon populations due to their unique life-history. Steelhead, unlike salmon, may not die after spawning. Therefore, carcasses may not be available for surveys. In addition, steelhead migrate and spawn during the late-fall, winter, and spring months when rivers have periods of pulse and high flows (e.g., flood releases) resulting in elevated water turbidities.

Two sampling methods will be implemented for the SMP:

1. **Electrofishing** — Raft mounted electrofishing vessels will be used to stun and capture fish species in areas potentially inhabited by CCV steelhead. Sampling frequency will be monthly from December – April. Capture of resident non-salmonid fishes multiple times is possible, thus monthly sampling is important to ensure fish recovery from sampling and handling stress between events. Electrofishing methods will follow National Marine Fisheries Service guidelines for sampling waters with anadromous fish.

2. **Fyke traps** — Fyke nets with wing walls, or steel fyke traps, will be used to sample upstream migrating CCV steelhead. These traps are funnel-shaped and are held open by hoops and specifically constructed for capturing salmonids without causing inadvertent injury. Traps will be checked at least once a day. Ample boat passage will be made available and fluorescent flagging, orange buoys, and flashing amber caution lights will alert river-users to sample gear.
In the event that CCV steelhead are captured during monitoring, fish will be recorded, measured, sexed (if possible), sampled for tissues, and checked for injuries and presence of tags. Fish will be Floy tagged with a unique identification number to document any recaptures that may occur in the study area. Captured steelhead will be transported downstream of the mouth of the Merced River in a 150-gallon fish transport tank. Transported steelhead will be acclimated in the transport tank to receiving water temperature and water quality at the predetermined release location before release.

**Where:** Steelhead monitoring activities are proposed for the area below Mendota Dam, or to the uppermost contiguous wetted section of the SJR, from the confluence with the Merced River, including adjoining sloughs.

**When:** December 1, 2018 – April 30, 2019. Steelhead monitoring activities will occur for two continuous weeks each of the four months in the Restoration Area.

**Considerations:** Access to the locations will occur from the public right-of-way or in areas where private landowners have granted access.

Questions about this activity should be directed to the study’s agency points-of-contact provide below.
